

Building a Modern

Personal Portfolio

Website in 10 Minutes

A complete step-by-step guide to creating a premium personal website with animated visuals using AI-powered tools.

Phase 1

Generate Visual Assets

Phase 2

Convert for Web

Phase 3

Engineer with AI

PHASE 1

Generating Visual Assets

STEP 01

Generate Static Frames

Use **Google Whisk** to generate cinematic portrait frames of yourself. Navigate to labs.google/fx/tools/whisk, upload your photo as the subject, then paste the prompt below.

■ WHISK STYLE PROMPT

Cinematic portrait with high-contrast dual-tone lighting, combining deep blues and fiery oranges. Mood: dramatic, premium, modern – like a movie poster hero section.

Key lighting: Strong overhead/front key in warm orange/red tones.

Fill lighting: Cool blue gradient shadows on the opposite side.

Background: Gradient from dark navy at top to warm orange/red at bottom.

Subject: Close-up, looking upward – inspiring, heroic vibe. Low-angle camera.

Finish: Smooth, professional, glossy. Subtle film-grain optional.

Composition: Subject centered; clear space left/right for text overlay.

STEP 02

Animate the Image

Select the frame you like, click the **Animate** button, and use the short prompt below to generate a smooth cinematic loop.

■ ANIMATION PROMPT

A smooth cinematic 3D transition

PHASE 2

Converting Animation for Web Use

STEP 03

Convert to WebP Format

Go to ezgif.com/video-to-webp, upload your animation, and apply these settings:

Setting	Value
Resolution	Original
FPS	15 (or closest native FPS)
Quality	85

STEP 04

Extract Frames

Split the WebP into individual frames:

- Click the **Split** button on ezgif.
- Download the generated **ZIP file**.
- **Unzip** the file on your computer.

PHASE 3

Engineering with Google Antigravity

STEP 05

Setup the Project

Open **Google Antigravity** (free download at antigravity.google).

- Drag and drop the unzipped frames folder into the tool.
- **Rename the folder to "sequence"** so the AI can locate the frames correctly.

■ *This naming is critical — the generated code references this exact folder name.*

STEP 06

Generate Code via AI

Open the **Agent Chat** panel, select **Gemini 3 Pro (high)**, then paste the system prompt below and hit **Run**.

■ ANTIGRAVITY SYSTEM PROMPT

ACT AS: A Senior Creative Developer (Awwwards-level) specializing in Next.js, Framer Motion, and high-performance scroll interactions.

TASK: Build a high-end "Scrollytelling" Personal Portfolio Website. Core mechanic: scroll-linked animation that scrubs through an image sequence as the user scrolls down.

TECH STACK:

- Framework : Next.js 14 (App Router)

- Language : TypeScript
- Styling : Tailwind CSS
- Animation : Framer Motion
- Rendering : HTML5 Canvas (for performance)

ASSETS: /sequence/ – WebP frames named sequentially (~89 frames).

COMPONENTS:

1. ScrollyCanvas.tsx – 500vh parent + sticky h-screen canvas. Preload images in useEffect. Map useScroll → frame index.
2. Overlay.tsx – Parallax text over canvas (z-10). Three sections:
0% → "My Name. Creative Developer." (center)
30% → "I build digital experiences." (left)
60% → "Bridging design and engineering." (right)
3. Projects.tsx – Glassmorphism grid (backdrop-blur, thin borders, subtle hover glow) placed after the scroll zone.

RULES: Use Canvas (not <video>). object-fit:cover for mobile/desktop. Write clean, modular code. Use nano banana for extra UI components.

STEP 07

Preview and Personalize

Run `npm run dev` to preview the site. Then provide the AI with your personal info to populate the content:

- Portfolio project details & case studies
- Work experience & timeline
- Skills, tools, and achievements

■ *The AI will auto-fill the Overlay text sections and Projects grid based on what you share.*

Quick Reference

Step	Tool	Action
01	Google Whisk	Generate cinematic portrait frames
02	Google Whisk	Animate selected frame
03	ezgif	Convert video → WebP (FPS 15, Q 85)
04	ezgif	Split WebP into individual frames + ZIP
05	Google Antigravity	Import frames folder, rename → 'sequence'
06	Google Antigravity	Run Gemini 3 Pro with system prompt
07	Terminal / AI	npm run dev → personalize content

Tools Used in This Guide

Tool	Purpose	URL
------	---------	-----

Google Whisk	AI image + animation generation	labs.google/fx/tools/whisk
ezgif	Video → WebP + frame splitting	ezgif.com/video-to-webp
Google Antigravity	AI-powered Next.js scaffolding	antigravity.google
Nano Banana	UI component library	nano.com (via Antigravity)
